

# Hi, AI (134 TWh)

*Text+Music: Yasmo & Flip*

*English translation: Christy Ellison Kemf and Andreas Kemf*

## STR1

Something here is changing, where should I begin?  
Everything is moving, there's no option to stand still.  
The Earth just keeps on turning, this I know, but to be frank,  
It's also getting hotter, and we have ourselves to thank.  
Oh my God, we're living in a science fiction film  
Living in the future, should I take the red or blue pill?  
Is it really all so bad, or do I just lack the skill  
to understand what the future and the world from me would will?  
Item 1 on the agenda would be well-being for all,  
Point 2, Don't just watch the climate change as it takes its toll.  
Point 3, not to incorrectly understand AI –  
Maybe together find a way to hit all three in the bullseye.  
AI is not the problem, I want everyone to see,  
Working with it could be, though, 'cause nothing's ever free,  
And AI needs a continuous supply of energy.  
Its calculations keep on churning. That much is a guarantee.

## HOOK

Hi, AI  
You are pretty bright.  
With the data that we feed you,  
nothing's gonna break your stride.  
But don't worry, we don't need your help for every single starter.  
Does a conversation with you cost us half a liter water.

Hi, AI  
You are pretty bright.  
But I don't need you all the time. I have my knowledge as a guide.  
The planet's already too hot. Hey AI, show us what you've got.  
Help us solve this, so on Earth we can continue to reside.

## STR 2

Hi AI. Why do you need so much water?  
How did you actually spend this past summer?  
Was it hot for you, too? Oh wait, aren't you always pretty warm?  
You need water to help you stay cool on your server farm.  
Ah, you live there. Well then, you're not invisible. I fear  
with more computing power, energy, and cooling every year.

Uh huh, so AI, I don't want to hit the fan.  
But does that work with a climate plan?  
Every day the whole world sends you a multitude of prompts.  
And you calculate and work it out until the answer comes.  
To help, we give you data, and your silicon chips run.  
And you just emit CO2, yeah, in tons.  
Hey AI, I know it's a double-edged sword,  
'Cause your work and your service clearly give us great rewards.  
So I'll tread lightly with you, no need to explain it all right now.  
But still, let's find solutions for the climate. Help us out.

HOOK

BRIDGE

GPT, you say you get so hot from your arithmetic.  
I say, OK, so go somewhere it's cold with ice that's nice and thick.  
I ask you, do you know that, besides data, you know nothing?  
And you bring up Socrates, who also knew that he knew nothing.  
I say, GPT how can we checkmate the climate crisis?  
You say, "That's not a fast one, even left to my devices."  
I say, "Well, how much energy are we talking about, here?"  
You say, "One hundred thirty-four terawatt hours per year."
